

ATLANS POST-PROCESSING SOFTWARE

VERSION 1.1.1

RELEASE NOTES

These Release Notes cover known issues. Please read these notes carefully before installing the software.

WHAT'S NEW

Bug fixed

- Unable to start 2 GNSS processing simultaneously
- Temporary files are not deleted if 'optimized' algorithm is selected.
- Memory crunched when processing large files.

Improvements

- Take into account the additional UTC leap second.
- Air and land tutorials updated.
- Improve Optimized algorithm processing time.
- Support Airins equipment.
- Support all Septentrio receivers.
- Support GLONASS L2P measurements recorded in base station files.

KNOWN ISSUES

- The 'horizontal view all' does not work properly:
When a new time view is opened the 'horizontal view all' command change the time scale to the whole period of the Xpf file, not only the period covered by the displayed data. It can be confusing for the user.
- Mouse and keyboard input locked to the "Processing panel":
Sometimes the GUI seems to be freezed, the mouse and keyboard inputs are only processed by the Processing panel. When it happens, use the Alt+Tab command to give focus to another application window and then go back to the main window.
